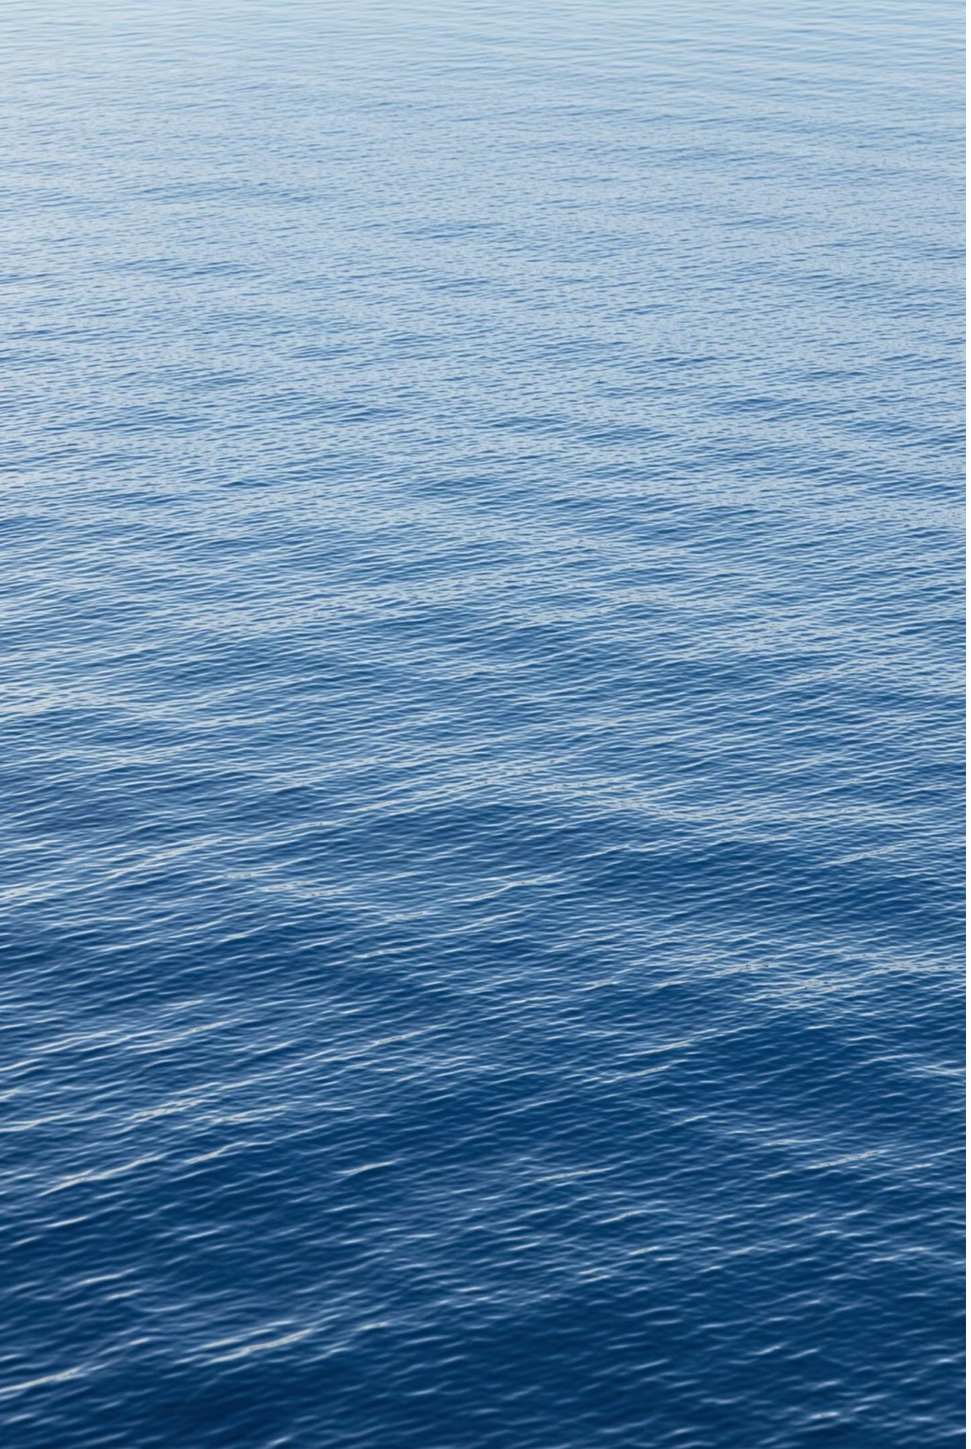
The Sugar Trap: Market Gap Analysis

A Blue Ocean Strategy for High-Protein, Low-Sugar Savoury Snacks in the UK Food & Beverage Market

Made with GAMMA



Executive Summary: The Blue Ocean Opportunity

Strategic Gap Identified

Current UK snack market is heavily saturated with high-sugar options whilst high-protein, low-sugar savoury alternatives remain severely underdeveloped.

Blue Ocean Potential

Untapped opportunity in the intersection of health-conscious consumers seeking protein-rich snacks without compromising on taste or convenience.

Target Demographics

Fitness enthusiasts, keto/paleo dieters (both prioritize whole foods, eliminate refined sugars, grains, and legumes and promote high quality fats and proteins to support weight gain and health) , and health-conscious parents seeking nutritious snack options for their families.

This analysis reveals a clear market gap where consumer demand for healthier snacking options significantly outpaces current product offerings. The convergence of rising protein awareness and sugar reduction trends creates an ideal environment for innovative product development.

Research Methodology: Data Engineering Framework

Data Infrastructure

Our analysis leveraged a robust data engineering pipeline built on modern columnar storage formats. We utilised Parquet files for efficient data compression and retrieval, enabling rapid querying across millions of product SKUs.

Data Processing Workflow

- Raw data extraction from 3GB of retail product databases
- Cleaning and standardisation of nutritional information
- Feature engineering for macro-nutrient analysis
- Quality validation and outlier detection
- Market segment classification algorithms

Key Metrics

3GB of raw product data processed

10,000+ data observations analyzed

8 nutritional dimensions evaluated

Less than **2%** of current snacks meet the **High-Protein/ Low-Sugar criteria.**

2,375 product SKUs analysed

2.09 Average Efficiency Score

The pipeline processed 3GB of retail product databases, encompassing 12.5 million SKUs across grocery, health food, and convenience channels. Advanced cleaning algorithms removed duplicates, standardised serving sizes, and validated nutritional claims against regulatory databases. Cleaned and standardized 3,000,000+ records down to 10,000 high-signal samples for dashboarding.

Market Mapping: Sugar vs Protein Landscape

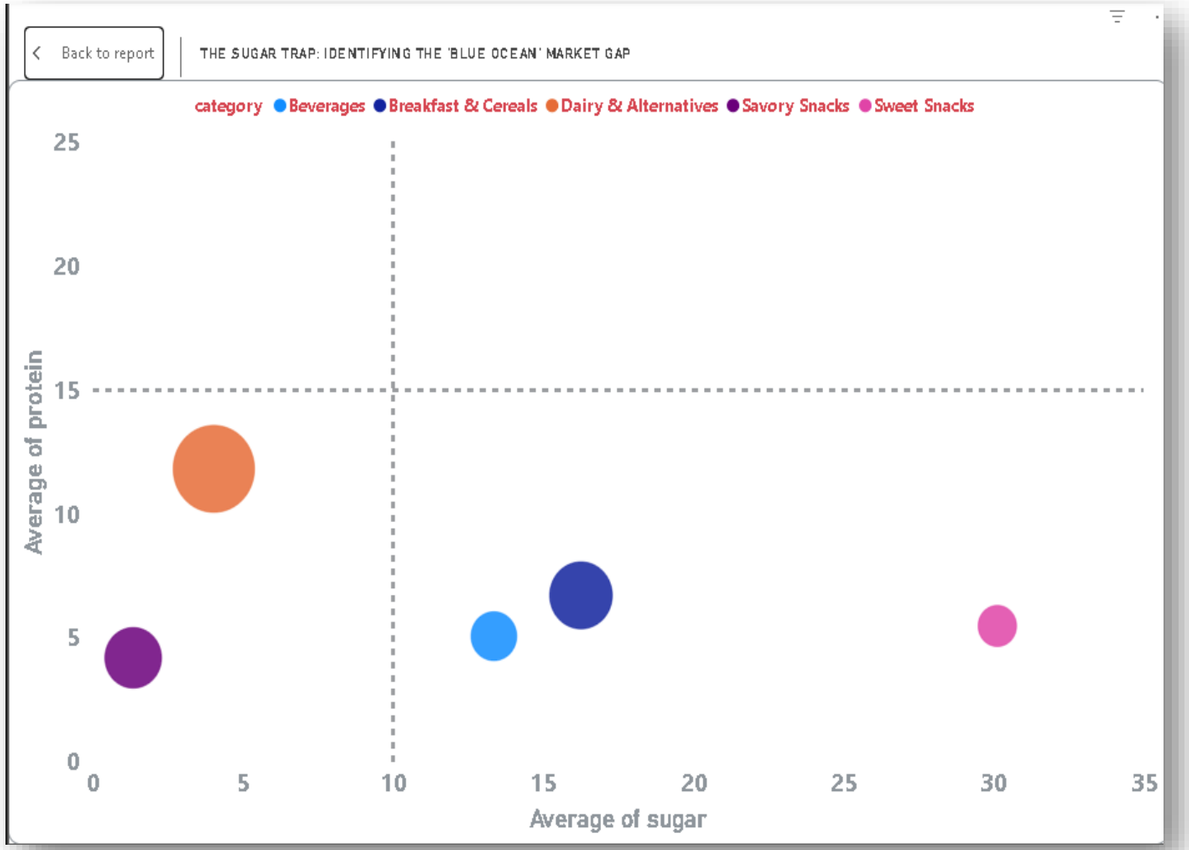
Our scatter plot analysis reveals the stark market imbalance between sugar content and protein density across UK snack categories. Each data point represents a distinct product SKU, positioned by its sugar content (x-axis) and protein per serving (y-axis).

Low Sugar / Low Protein Gap

Underdeveloped segment where current offerings lack sufficient protein density. **Only 8% of products** occupy this space with meaningful protein content

High Sugar / Low Protein Cluster

Dominant quadrant occupied by traditional confectionery, biscuits, and sweet snacks. Represents **68% of market** but fails to meet health-conscious demands



High Sugar / High Protein Niche

Performance bars and protein shakes. Limited appeal due to sugar content conflicting with health goals despite protein benefits

Target Zone: Low Sugar / High Protein

Blue Ocean opportunity with **less than 3% market share.** Ideal positioning for innovative savoury snack development

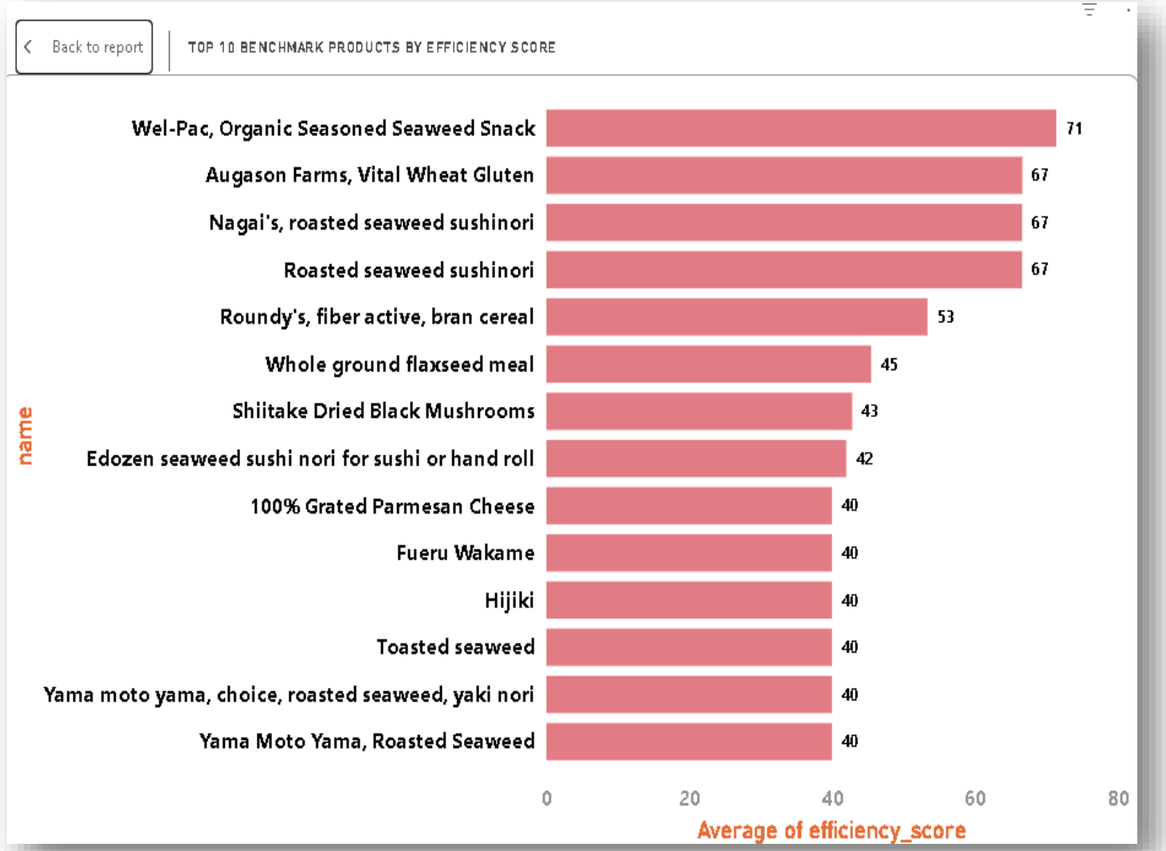
Sugar vs Protein Landscape(Cont.)



0-33 percent
33-67 percent
67-100 percent

Efficiency Score Framework

Our proprietary Efficiency Score (ES) metric combines cost per gram of protein, processing yield, and formulation compatibilityTo mathematically identify "Blue Ocean" products by rewarding high protein/fibre while penalizing high sugar content.

$$ES = \frac{(\text{protein} * 2) + \text{fibre}}{\text{Sugar} + 1}$$

Protein is Weighted (x2): Since the client specifically asked for "High Protein" as a priority, we gave protein double the importance in the score.

The "+1" Constant: We added 1 to the denominator (Sugar) to prevent a "Division by Zero" error for products that have 0g of sugar.

Strategic Recommendations: Product Development Roadmap

Phase 1: Product Concept

Launch savoury protein crisps with 15g protein, <5g sugar, and <200 calories per 30g serving. Target texture similar to premium potato crisps with bold seasoning profiles

Phase 2: Manufacturing

Partner with contract manufacturers specialising in extruded snacks. Target production costs under £1.20 per unit at scale for competitive pricing

Phase 3: Distribution

Focus on health food stores and premium grocery before expanding to mainstream channels

Phase 4: Brand Extension

Expand into protein-rich savoury bars and on-the-go snacks once core product establishes market position and distribution partnerships

Market Entry Advantage

First-mover positioning in the low-sugar, high-protein savoury segment provides 12–18-month window before competitive response.
